Static Files

CSS files, Javascript Files, image files, video files etc are considered as static files in Django.

Django provides django.contrib.staticfiles to help you manage them.

django.contrib.staticfiles collects static files from each of your applications (and any other places you specify) into a single location that can easily be served in production.

How to Create Static Folder and Files

We create **static** folder inside Root Project Folder then inside **static** folder we create required folders which will contain all static files respectively like css folder will contain all css files, image folder will contain all images and so on.

```
geekyshows
     static
          CSS
               style.css
               custom.css
          images
               love.jpg
               pic1.jpg
     templates
     geekyshows
     manage.py
     course

    M love.jpg
home.html
     db.sqlite3
   💎 manage.py
```

load Template Tag

```
{% load module_name %} – It loads a custom template tag set.
```

Example:- {% load emotags %}

Example:- {% load geek.mytags %}

Example:- {% load emotags geek.mytags %}

Template would load all the tags and filters registered in emotags and mytags located in package geek.

You can also selectively load individual filters or tags from a library or module, using the from argument. Example - {% load cry lol from emotags %}

The template tags/filters named cry and lol will be loaded from emotags.

static Template Tag

{% static filename %} – This tag is used to link to static files that are saved in STATIC_ROOT. If the django.contrib.staticfiles app is installed, the tag will serve files using url() method of the storage specified by STATICFILES STORAGE.

```
Syntax:-
{% load static %}
{% static filename %}
{% static path/filename %}
{% static path/filename as variable %}
Example:-
<link rel="stylesheet" href="{% static 'style.css' %}" >
<link rel="stylesheet" href="{% static 'css/style.css' %}" >
<img src="{% static 'images/love.jpg' %}">
{% static "images/love.jpg" as mylove %}
<img src="{{ mylove }}">
```

get_static_prefix Template Tag

{% get_static_prefix %} - We should prefer the static template tag, but if you need more control over exactly where and how STATIC_URL is injected into the template, you can use the get_static_prefix template tag.

```
Example:-
{% load static %}
<img src="{% get_static_prefix %}images/love.jpg">
```

There's also a second form you can use to avoid extra processing if you need the value multiple times.

```
{% load static %}
{% get_static_prefix as STATIC_PREFIX %}
<img src="{{ STATIC_PREFIX }} images/love.jpg">
<img src="{{ STATIC_PREFIX }} images/pic1.jpg">
```

STATIC_URL – This is the URL to use when referring to static file located in STATIC_ROOT. It must end in a slash if set to a non-empty value.

Example:- "/static/"

Example:- "http://static.example.com/"

STATIC_ROOT – This is absolute path to the directory where *collectstatic* will collect static files for deployment. It is by default None.

Example: - "/var/www/example.com/static/"

Example:- os.path.join(BASE DIR, 'static/')

STATICFILES_DIRS - This setting defines the additional locations the *staticfiles* app will traverse if the *FileSystemFinder* finder is enabled, e.g. if you use the *collectstatic* or *findstatic* management command or use the static file serving view. It is by default an empty list.

```
STATICFILES_DIRS = [
   "/home/special.geek.com/geek/static",
   "/home/geek.com/geek/static",
   "/opt/webfiles/common",
]
```

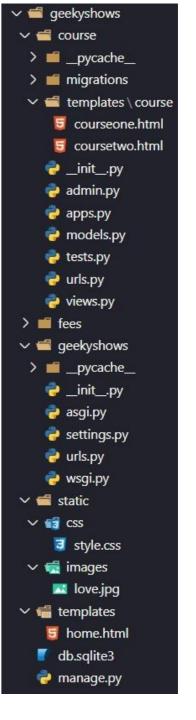

STATICFILES_STORAGE - The file storage engine to use when collecting static files with the collectstatic management command.

Default: 'django.contrib.staticfiles.storage.StaticFilesStorage'

A ready-to-use instance of the storage backend defined in this setting can be found at django.contrib.staticfiles.storage.staticfiles_storage

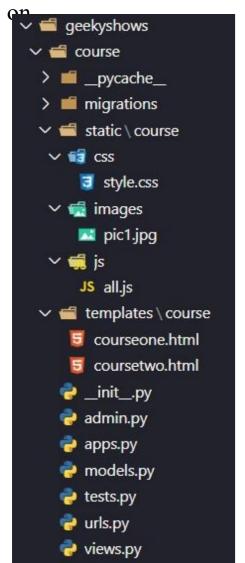

Geeky Steps

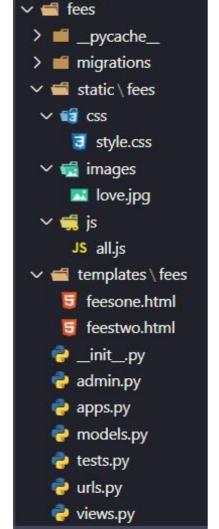

- Create Django Project: django-admin startproject geekyshows
- Create Django Application1: python manage.py startapp course
- Create Django Application2: python manage.py startapp fees
- Add/Install Applications to Django Project (course and fees to geekyshows) using settings.py INSTALLED_APPS
- Create templates folder inside each application and inside Root Project Folder
- Check 'APP_DIRS': True in settings.py
- Add templates directory which is inside Root Project Folder, in settings.py
- Create **folder** inside **app/templates** directory for template files
- Create template files inside app/templates/folder
- Create template files inside templates folder which is inside Root Project Folder
- Create **static** folder inside Root Project Folder
- Create css, js, images, video etc folder inside static folder
- Create static files inside css, js, images, video etc folder.
- Write View Function inside views.py file
- Define url for view function of application using urls.py file
- Write Template files code
- Write Static file code

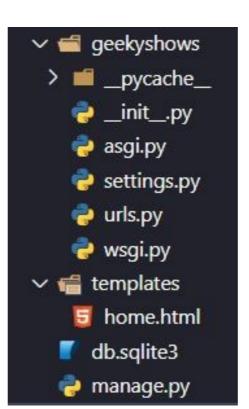

How to Create Static Folder and Files inside Application

We create **static** folder inside Application Folder then inside **static** folder we create required folders which will contain all static files respectively like css folder will contain all css files, image folder will contain all images and so

Add Static in settings.py

```
settings.py
Old Django Version 3.0
TEMPLATES DIR = os.path.join(BASE DIR, 'templates')
STATIC DIR = os.path.join(BASE DIR, 'static')
TEMPLATES DIR = BASE DIR / 'templates'
STATIC DIR = BASE DIR / 'static'
INSTALLED APPS = [
                               Django Version 3.1
    'course'
TEMPLATES = [
    'DIRS': [TEMPLATES DIR]
STATIC URL = '/static/'
STATICFILES DIRS = [ STATIC DIR ]
```

```

Use Static Files in Template Files

- First Load Static Files
- Reference Static Files

static Template Tag

get_media_prefix - Similar to the get_static_prefix, get_media_prefix populates a template variable with the media prefix MEDIA_URL, e.g.:

```
{% load static %}
<body data-media-url="{% get media prefix %}">
```

By storing the value in a data attribute, we ensure it's escaped appropriately if we want to use it in a JavaScript context.
