# Strict Mode

StrictMode is a tool for highlighting potential problems in an application.

StrictMode does not render any visible UI. It activates additional checks and warnings for its descendants.

Strict mode checks are run in development mode only; they do not impact the production build.

Ex:-

<React.StrictMode>

    <User />

</React.StrictMode>

# Strict Mode

**StrictMode currently helps with:**

- Identifying components with unsafe lifecycles
- Warning about legacy string ref API usage
- Warning about deprecated findDOMNode usage
- Detecting unexpected side effects
- Detecting legacy context API
